Feedback

Maybe I should rethink the must-haves since it is a big project!

Inventory management is the heart of the application

We can use MySQL

Separate the requirements into multiple ones

Only create Use cases for the more complex scenarios

Look for proffesional aligning standerts.

Number the pages in the document.

Add stakeholders to project plan - myself, teachers, users.

Constraints are out of my control.

Add thought through risks or remove them.

GDPR - look into it!

Be more specific (~~what~~) for the deliverables.

URS- introduction should reference the Project plan, and say what the current document is about.

Refactor the System overview to a "the user wants" format

The requirements should be more general!

The use case should display a play between the user and the system.
